

Build confidence in your data workflows

What is DataStudio?

DataStudio is a web application for collaborative, verifiable data analysis. It gives teams the tools to build trusted, reusable and extendable data workflows.

The problem

- Data workflows are often spread across files, scripts, and spreadsheets, making results hard to verify.
- Valuable time is lost hunting down missing data or rewriting analysis code.
- Data workflows often require advanced coding skills alongside domain-specific knowledge.

How does DataStudio help?

DataStudio provides an easy-to-use web interface for teams to perform data analysis workflows while automatically recording full analysis history. Sharing a complete analysis is as easy as sharing a Google Doc.

Features

- **End-to-end verification** Complete data analysis history is captured automatically. Analyses are instantly reproducible and verifiable, even when shared.
- **Easy collaboration** Browser-based interface allows for easy collaboration and sharing of data analysis internally and externally.
- **User-friendly** Easy to install and use with no complex installation or coding knowledge required, improving user productivity.
- **Data sovereignty** All processing occurs in the browser or on a cloud provider of your choice, leveraging your existing storage solutions. DataStudio never has access to your data.
